

**Table S3: Statistics derived from the log-linear model (screening, income, education, age) underlying the test of independence between cervical cancer screening uptake, per capita income, educational attainment, and age group**

<b>Statistics</b>	$\chi^2$	<b>Degrees of freedom</b>	<b><i>P</i></b>
LRS	41.83498	18	0.001166105
Pearson	37.55121	18	0.004438751

The *P* value provided in the mosaic plot is based on Pearson.  
 LRS: Likelihood ratio statistic, Screening: CC screening
